

UNICEF Togo DFA P2637

Strengthening the Statistical System for Stronger Monitoring and Reporting on the SDGs

Community Systems Foundation (CSF) is assisting the government of Togo to strengthen M&E processes by introducing a new data monitoring system.

CSF, with the support of UNICEF, rolled-out several DataForAll (DFA) products in Togo to track and report progress towards the achievement of the SDGs.

The government of Togo used DevInfo to digitise all of Togo's information and monitor developmental progress. In upgrading to DFA applications, government counterparts have a stronger set of tools to compile, manage and disseminate data on related documents regarding SDGs.

The new DFA Data Manager application allows system administrators to manage large data sets. CSF is also developing a mobile application that allows data dissemination in becoming more accessible.

The transition from DevInfo to DFA entails more flexibility to the power users since the management of the database becomes easier. They can easily manage the database through the DFA Data Manager and the data gets easily reflected in data dissemination products like - DFA Dashboard, DFA Visualiser as well as the mobile application.

This new portal puts emphasis on data in all its format - resources, metadata, database that can be easily accessible and managed.

Features

- Planning, Monitoring and Reporting Platform to monitor their developmental progress
- An interactive mapper to monitor the interventions of UNICEF.
- Mobile application to improve data dissemination
- A powerful visualizer tool configured to the database for an intensive data query
- Dynamic data portal to share metadata as well as key documents.

Benefits

- Data-driven, evidence-based platform to inform national policies.
- Enabling effective and efficient monitoring and reporting of results.
- Provides localization of data entry
