

DI Monitoring Côte d'Ivoire

Platform for monitoring the National Development Plan

To better monitor the national development plan, the Ministry of Planning of Cote D'Ivoire has adopted DI Monitoring with the support of UNICEF.

The DI Monitoring application, a web-based data management tool powered by DevInfo technology, facilitates the tracking of data management plans; the application supports the creation of a layered indicator framework, setting baseline values and targets and then importing real-time socioeconomic data from a DevInfo database at regular intervals to track progress towards the target.

In 2016, the Ministry of Planning of Cote D'Ivoire began working on DI Monitoring to build a National development plan (2016-2020) with a set of indicators to better monitor and disseminate results. Through various capacity building sessions (in-country as well as in CSF/AISPL's New Delhi lab), a core team of administrators has developed the knowledge to manage the system.

CSF supported the Ministry of Planning with managing the contents of their strategic and operational plans, and also developed a custom public dashboard and portal to support better visualization and dissemination of programmatic and budget information. The end product makes it easy for citizens to participate in the development dialogue.

Features

- Dynamic, collaborative monitoring system is used by and features information on all key sectors
- Customized report by Ministry
- Project Implementation Teams and Project Steering Committee pushing monitoring objectives forward at the national level

Benefits

- Free and open source software to access information publicly
- Fully customizable to meet specific country requirements
- Facilitates monitoring planned against actual values to assess progress
- Facilitates the exchange of data between line ministries and the Ministry of Statistics
- Compatible with other DevInfo products for future developments (e.g. dashboards)
